TMAC™
THEW &
McCANN
GROUP

Another great example of TMAC active innovation, the Universal Lifting Kit, has been redesigned and improved. The lifting arm when used in conjunction with the pole or crossarm brackets takes most of the weight and stress off lifting overhead conductors from the existing support, in preparation for the crossarm, insulator replacement and conductor support. It enables the changeover to be carried out quickly and safely. The improved capability has been proven through extensive load testing.

ACTIVE INNOVATION
